Abstract

The Sales/Demand Forecasting System is a data analytics and machine learning project designed to predict future sales or product demand using historical sales data. Accurate demand forecasting helps businesses make better decisions regarding inventory management, resource planning, and sales strategies. The proposed system analyzes historical sales patterns and identifies trends and seasonal variations in the data.

Time-series forecasting techniques such as ARIMA and Prophet are used to develop forecasting models and predict future demand. The system includes data preprocessing, exploratory data analysis, time-series modeling, model evaluation, and visualization of actual and predicted sales. A user-friendly dashboard can also be developed to display historical trends, forecasted demand, and model results interactively.

The proposed system aims to provide reliable demand predictions that can help organizations reduce overstocking and stock shortages while improving overall planning and decision-making.
